Docs Health Scheduling & Email Automation - PRD Workflow

Prepared from stakeholder discussion involving Britny Miller, Sagar Reddy, and Rakesh Reddy.

Objective

Build an AI-enabled scheduling and patient communication platform integrated with email workflows, patient records, insurance verification, and scheduling operations.

Current Workflow

Users primarily work within Patient Charts and Schedule modules. Registration includes demographics, insurance entry, eligibility verification, and document/image collection.

Scheduling Workflow

1. Receive scheduling request. 2. Identify/create patient. 3. Enter demographics. 4. Capture insurance. 5. Run eligibility verification. 6. Confirm network eligibility. 7. Schedule appointment. 8. Update patient chart.

Patient Registration

Collect contact information, demographics, insurance details, patient photo/identification, and maintain patient chart data.

Insurance Verification

Store primary medical payer information, run eligibility checks, review responses, and validate doctor-network compatibility.

AI Email Automation

Attach scheduling emails to AI application. Convert incoming emails into portal requests. Match patient information automatically. Generate AI responses when confidence and matching criteria are met.

Manual Review Triggers

Unmatched patient records, incomplete data, conflicting information, failed eligibility verification, or low-confidence AI decisions require human review.

Portal Workflow

Email -> Request Intake -> Patient Match -> AI Analysis -> Auto Response OR Manual Review -> Resolution Tracking.

Key Features

Centralized request management, Outlook integration, automated responses, insurance validation assistance, audit trail, and dashboard reporting.

Future Validation

Conduct demonstrations with scheduling staff before production rollout. Validate response quality, workflow accuracy, and user adoption.
